#### UNDER DEVELOPMENT

# **ARM7TDMI Processor Functional Description**

This hardware component is a ARM7TDMI processor core. This is only an ISS, which should be wrapped with an <u>IssWrapper</u>.

The simulation model is actually an instruction set simulator with an ARM7TDMI pipeline.

Currently it only exists in bigendian form.

# IMPORTANT: steps to apply before using the ARM7TDMI

Before compiling any SoClib simulator using the ARM7TDMI you will need to download the UNISIM ([http:\\www.unisim.org]) library (well, just a piece of it, the unisim\_lib).

To do so just download it using svn from <a href="https://unisim.org/svn/devel/unisim">https://unisim.org/svn/devel/unisim</a> lib with the following command:

• svn import <a href="mailto:?https://unisim.org/svn/devel/unisim">?https://unisim.org/svn/devel/unisim</a> lib

You will have to enter a username and password. If you do not have access to the UNISIM development, you can simply use 'guest'/'guest' for username and password respectively. Once you have downloaded UNISIM you will need to create a link in trunk/soclib/lib/arm7tdmi/include/iss/ and trunk/soclib/lib/arm7tdmi/src/iss/ to <your\_path\_to\_unisim\_lib>/unisim.

If you wish you can download the full UNISIM library by downloading unisim\_tools and unisim\_simulators:

- svn import ?https://unisim.org/svn/devel/unisim\_tools
- svn import ?https://unisim.org/svn/devel/unisim\_simulators

Finally you will have to set your soclib.conf (source:trunk/soclib/utils/conf/soclib.conf) file to compile correctly the ARM7TDMI component. Here you have an example of configuration that correctly sets the flags to compile ARM7TDMI:

The flags you will need to compile the ARM7TDMI component are: -DSOCLID and

-D\_STDC\_CONSTANT\_MACROS. In the previous example you can see that the default toolchain has been augmented to define those flags.

# **Component definition**

Available in source:trunk/soclib/soclib/lib/arm7tdmi/metadata/arm7tdmi.sd

#### **Usage**

ARM7TDMI has no parameters.

```
Uses('iss_wrapper', iss_t = 'common:arm7tdmi')
```

# **ARM7TDMI Processor ISS Implementation**

The implementation is in

- source:trunk/soclib/lib/arm7tdmi/include/iss/arm7tdmi.h
- source:trunk/soclib/lib/arm7tdmi/src/iss/arm7tdmi.cpp

The previous files use the ARM7TDMI implementation provided in the UNISIM library.

### **Template parameters**

This component has no template parameters.

## **Constructor parameters**

```
ARM7TDMIIss(
sc_module_name name, // Instance Name
int ident); // processor id
```

## Visible registers

UNDER DEVELOPMENT

### **Interrupts**

#### UNDER DEVELOPMENT

The handling and prioritization of the interrupts is deferred to software.

#### **Ports**

None, it is to the wrapper to provide them.

# Compiling programs for ARM7TDMI with SoClib

Before compiling a program for the ARM7TDMI with the SoClib framework you will need to define some system variables (usually on the ~/.soclib/soft\_compilers.conf) needed to find the ARM compiler. Below you have an example:

```
arm7tdmi_CC_PREFIX = armv5b-softfloat-linux-
arm7tdmi_CFLAGS = -nostdinc -gstabs+
arm7tdmi_LDFLAGS = -nostdlib
```
