

# VciRam Functional Description

This VCI target is an embedded SRAM controller. This hardware component handles independent memory segments. Each segment is defined by a base address and a size (number of bytes). Both the base and the size parameters must be multiple of 4. The segments allocated to a given instance of this component are defined in the [Mapping Table](#).

Each segment is implemented as a dynamically allocated array in the constructor.

A MultiRam will initialize its segments from a binary if an ElfLoader? is attached to it.

## Component definition

Available in source:trunk/soclib/module/internal\_component/vci\_ram/caba/metadata/vci\_ram.sd

## Usage

VciMultiRam has no other parameter than VCI ones, it may be used like others, see [SoclibCc/VciParameters](#)

```
Uses( 'vci_multi_ram', **vci_parameters )
```

## VciMultiRam CABA Implementation

The caba implementation is in

- source:trunk/soclib/module/internal\_component/vci\_ram/caba/source/include/vci\_ram.h
- source:trunk/soclib/module/internal\_component/vci\_ram/caba/source/src/vci\_ram.cpp

## Template parameters:

- The VCI parameters

## Constructor parameters

- Uninitialized MultiRam

```
VciMultiRam(
    sc_module_name name,                                // Instance name
    const soclib::common::IntTab &index,                // Target index
    const soclib::common::MappingTable &mt)             // Mapping Table
```

- Elf-Initialized MultiRam

You may load a binary file, by creating a loader:

```
soclib::common::ElfLoader loader( "a.out" );
VciMultiRam(
    sc_module_name name,                                // Instance name
    const soclib::common::IntTab &index,                // Target index
```

```
const soclib::common::MappingTable &mt, // Mapping Table  
soclib::common::ElfLoader &loader);
```

On reset, any loadable segment in ELF file will be reloaded .

## Ports

- sc\_in<bool> **p\_resetn** : hardware reset
- sc\_in<bool> **p\_clk** : clock
- soclib::common::VciTarget<vci\_param> **p\_vci** : The VCI port
