

DSX

General Presentation

DSX stands for Design Space Explorer. It helps the system designer to map a multi-threaded software application on a shared memory multi-processor hardware architecture (MP-SoC) modeled with the SoCLib components.

It supports the hardware software codesign approach, allowing the designer to define successively :

the software application structure : number of tasks and communication channels
the hardware architecture : number of processors, number of memory banks, etc.
the mapping of the software application on the hardware architecture
