What is SoCLib

- SoCLib is an open platform for virtual prototyping of multi-processors system on chip (MP-SoC).
- The core of the platform is a library of SystemC simulation models for virtual components (IP cores)
- The project started as an ANR-funded project. It is now maintained at [?Lip6](#)

Technical features

The main concern is true interoperability between the SoCLib IP cores :

- All simulation models are written in SystemC, and can be simulated with the standard SystemC simulation environment distributed by the OSCI organization.
- Two types of models are available for each IP-core:
 - ♦ CABA (Cycle Accurate / Bit Accurate),
 - ♦ TLM-DT (Transaction Level Modeling with Distributed Time)

Availability

- All [simulation models](#) and most associated tools are distributed as free software.
- The SoCLib documentation is on this website

Usage

SoCLib Components

- [SoCLib Components General Index](#) : documentation about the available hardware components (IP cores)

Installation

- If you want to try SoCLib without going through the installation process, the [?SoCLib Virtual machine appliance](#) may help you !
- [Installation Notes](#) : how to install the SoCLib platform on your computer
- [Frequently asked questions](#) is useful when things goes wrong

Building platforms

- [Soclib Cc](#) is the current build system for SoCLib platforms.
 - ♦ [SoclibCc/DesignGuide](#) is an attempt to justify the choices made in soclib-cc
 - ♦ [Soclib Cc/And Modelsim](#) describes how to use SoCLib CABA models in ModelSim, to make RTL+CABA co-simulation
 - ♦ [Soclib Cc/Meta Data](#) describes the metadata (.sd) file format
 - ♦ [Soclib Cc/Soclib Conf](#) describes the configuration file format

Middleware

- [MWMR](#) : Hardware / Software communication middleware

SoCLib guest OS support

- [DNA/OS](#) : DNA/OS is a micro-kernel for MPSoCs. It supersedes MutekA, and still provides the POSIX thread API.
- [?MutekH](#) : Exo-kernel based OS for classical and heterogeneous MPSoCs with POSIX threads support
- [?NetBSD](#) : Highly portable Unix-like Open Source operating system
- [?eCos](#) : An open source, royalty-free, real-time operating system intended for embedded applications.
- [?RTEMS](#) : Real-Time Operating System for Multiprocessor Systems

SoCLib Tools

- [DSX](#) : Design Space Exploration tool
- [SystemCASS](#) : Fast SystemC simulation kernel
- [SoCView](#) : Interactive simulation environment for debug and instrumentation
- [GdbServer](#) : A GDB server for multi-processor architectures
- [MemoryChecker](#) : A memory access error checker similar to valgrind.
- [GAUT](#) : A high-level synthesis tool allowing to generate automatically systemC CABA and TLM-T files.

Tutorials

- [?DSX tutorial](#)
- [Motion-JPEG and OS tutorial](#)

Development

Writing and design guides

- [General SoCLib Rules](#) : general rules regarding the SoCLib components.
- [Processor Modeling](#) : a general method to write generic processor models.
- [CABA Writing Rules](#) : rules to write SystemC CABA simulation models.
- [TLM-DT Writing Rules](#) : rules to write SystemC TLM-DT simulation models.
- [Critères Pour Plate-Forme TLM-T](#) : criteria defined for writing TLM-T simulation models.
- [CABA/TLM-DT Transactors](#) : general principles
- [Adding new components to the library](#) : the rules to follow to add a new IP core to the library.
- [Vci Protocol](#) : VCI protocol considerations in SoCLib

SoCLib Resources

Mailing list

The dev@? Mailing list is public and targets general discussion about SoCLib component development.

To join the list, either

- send an email to dev-subscribe@?;
- see <http://www.soclib.fr/www/info/dev>.
